House, V.I. Stenuravitskii, Tech. Ed.: G.V. Spivakovsky.

PURPOSE: This collection of articles is intended for technical personnel in machine plants, designing organizations and scientific-research institutions. It may also be useful to skilled workers.

CONTENTS: The collection consists of papers presented at a conference on Group Processing in the Machine and Instrument Industries, held November 24-26, 1959 in Leningrad. The conference was called by scientific and technical societies of the machine and instrument industry, GTRK NIIIM and Leningradchel. The articles are based on the experience of industry in introducing the group principle in processing. They discuss basic trends in development of group methods as the basis of modernized continuous production. The development of automated production lines, construction of assembly, and automation and specialization of machine tools are discussed. Problems dealing with the introduction of group-processing methods into processing on various machine tools and into production of blanks (carrying, pressuring, pressing of plastics) are considered. Planning, standardization, and methods for calculating the economic efficiency of group processing are also treated. 30 personalities are mentioned. There are no references.

ORG: VNIIT vogenmashTITLE: Effect of gas-shielded arc cutting on the properties of Kh18N10T steelSOURCE: Avtomacheskaya svarka, no. 10, 1965, 35-37TOPIC TAGS: steel, stainless steel, austenitic steel, chromium containing steel, nickel containing steel, steel cutting, shielded arc cutting, plasma cutting/Kh18N10T steel

ABSTRACT: Hot-rolled Kh18N10T stainless steel plates [0.11% C, 17.6% Cr, 10.7% Ni, 0.75% Ti] were cut by a gas-shielded electric arc in order to investigate the effect of cutting conditions on the structure, corrosion, and weldability. The gas-electric cutting was done under mild conditions (current $I = 330-360$ amp, arc voltage $U_a = 44$ v, cutting speed $V_c = 270$ mm/min, nitrogen consumption $Q_{N_2} = 1600$ l/hr, cut width $d_c = 6$ mm) and under severe conditions ($I = 400$ amp, $U_a = 85$ v, $V_c = 1400$ mm/min $Q_{N_2} = 5000$ l/hr, $Q_{H_2} = 1600$ l/hr, $d_c = 4$ mm). Regardless of the regime of cutting, the surface of the cut had a thin Fe_3O_4 film which, under optimum cutting conditions, was about $0.6 \mu m$ thick. Changes in the structure of the metal cut under mild and

Card 1/2

I 9443-66

ACC NR: AP5026290

severe conditions extended to a depth of 1.5 and 0.2 mm, respectively. The conditions of cutting had little effect on the rate of general corrosion of the as-cut surface, which was only slightly higher than the rate of $1.5 \text{ g/m}^2 \cdot \text{hr}$ for mechanically cut specimens. After a sensitizing heat treatment, the rate of general corrosion of mechanically cut specimens increased by 2-6 times, and that of the arc-cut specimens, by 8-10 times. The corrosion rate of the surface of the cut prior to sensitizing was 2-3 times higher, and after sensitizing, 10-13 times higher than that of the base metal. This increase, however, is not dangerous since it does not extend beyond a small fusion zone. Hence, gas-shielded arc cutting of Kh18NiOT steel should be done preferably under severe conditions, which ensure a narrow fusion zone. No cut specimens, regardless of the method and conditions of cutting, exhibited intergranular corrosion. Sound welds were obtained by submerged-arc welding of cut specimens without additional preparation, and no difference was observed in the structure of the metal of the weld and heat-affected zone in specimens cut by different methods. Orig. art. has: 4 figures and 1 table.

Nature of the colloidal fraction in the clays of Gorodnyansk, White Russia. M. I. Barborodov and V. V. Maro. Doklady Akad. Nauk S.S.R., 78, 339-42 (1951).—Ten samples of clays from the Gorodnyansk deposits in the Pinsk district of White Russia were examined, primarily to determine the influence of the colloidal fraction (< 0.001 mm. diam.) on ceramic and refractory properties. The Gorodnyansk clays can be divided into 5 classes as regards color from black through gray to light gray, and further distinguished by the presence or absence of ferruginous spots. The black clays are the most dispersed, contg. 67.5% of the finest fraction < 0.001 mm. particle diam. The light and light-gray clays contain less than 50% of this fraction, one sample having only 33.7%. The data indicate that the light clays, with the lowest colloidal fraction, dry without cracking or deforming, while the black and dark-gray clays under the same conditions crack and deform badly. The same holds for the behavior in the kiln. Exptl. curves show that the amt. of colloidal matter has a profound influence on ceramic properties. A second object of the paper is to establish the mineralogical compn. of the colloidal fraction of a clay. For this purpose the fraction < 0.001 mm. was investigated: (1) Loss in weight when heated to 105, 180, 300, 400, 450, 500, 600, 700, and 800° was obtained. The greater part of the water was given off in the interval 400-600°, characteristic of

Nature of finely dispersed fractions of clays from some deposits in the Belorussian S.S.R. M. A. BEZHOROV, E. B. MAZO, AND N. I. ZUEV. Izdat. Akad. Nauk Beloruss. S.S.R., 1953, No. 4, pp. 115-27; Chem. Abstr., 49 [2] 789f (1955).—Clays from 5 deposits were examined. The mineralogical composition was determined on the fraction <0.001 mm. The fine fractions of all the clays were polymineral and contained at least two minerals. The clays contained a montmorillonite-type mineral resembling beidellite. The clays contained 2.17 to 7.63% Fe oxides, but none was found in the fine state. *Reprinted by permission of the author.*

COVERAGE: The materials contained in this book on vitriform systems were compiled by the Scientific Research Laboratory of Glass and Silicates of the Belorussian Polytechnic Institute and the Laboratory of the Physical Chemistry of Silicates of the Belorussian Academy of Sciences. The book surveys all literature on the properties of vitriform systems available up to 1958. All vitriform systems are presented with "composition-property" diagrams. Figures 1 through 5 provide a graphic summary of the present state of knowledge of the properties of various vitriform systems. The systems are presented diagrammatically in increasing order of complexity. One-component to eight-component systems are treated. This survey shows that to date 177 systems have been studied and 568 "composition-property" diagrams have been constructed. Chapter I was written by Ye.A. Poray-Koshits. References accompany individual chapters.

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 23, 1961, 341-342,
abstract 23K267 (Sb. "Stekloobrazn. sostoyaniye", M.-L.
AN SSSR, 1960, 441-444. Diskus., 446)

TEXT: The following six ternary, quarternary and quaternary phosphate systems have been investigated: $K_2O - PbO - P_2O_5$, $Al_2O_3 - B_2O_3 - P_2O_5$, $K_2O - Al_2O_3 - B_2O_3 - P_2O_5$ (with 5, 10, 15, and 20% Al_2O_3), $K_2O - Al_2O_3 - B_2O_3 - P_2O_5 - SiO_2$ (with 15% K_2O , 20% B_2O_3), $K_2O - PbO - Al_2O_3 - P_2O_5 - SiO_2$ (PbO 10%, SiO_2 15%), $K_2O - Al_2O_3 - P_2O_5$. The glass formation ranges, thermal expansion and chemical stability of these systems were studied. In both the borophosphate silicic and lead phosphate silicic glasses, chemical stability was improved by the introduction of Al_2O_3 . The chemical stability of glasses is very closely

S/081/61/000/023/040/061
B138/B101

related to their structure and variations are directly connected with structural transformations. Experimental factors are explained from the viewpoint of the structure of the glass former P_2O_5 . The introduction of tetrahedrons (SiO_4) into a phosphate glass skeleton is found to have a very much smaller effect than AlO_4 . It suggested that TiO_2 , BeO , ZrO , and ThO_2 should, in ascending order, have a positive influence in increasing the chemical stability of phosphate glasses. TITLE:

Enamels for Aluminum on the Basis of the Lead-phosphate-silicate
System

PERIODICAL: Steklo i keramika, 1960, Nr 1, pp 35-39 (USSR)

ABSTRACT:

The authors and N. P. Grishina had previously produced easily fusible glasses suitable as a basis of enamels for aluminum. They were, however, not resistant to 4% acetic acid. In the present paper, the authors describe a number of experiments to obtain mixed lead-phosphate-silicate enamels resistant to 4% acetic acid. They refer to papers by A. A. Appen and Gan Fu-Si, as well as K. P. Azarov and V. Ye. Gorbatenko. Figures 1 and 2 show the glass-formation ranges of the systems investigated. Table 1 indicates the chemical resistivity and coefficients of thermal expansion. Table 2 lists the compositions, table 3 the essential technological characteristics, and table 4 some technical properties of the enamels obtained. Table 3 presents the optimum enamel compositions (Nr 264 - white, *(checkmark)*

Card 1/2

SOV/72-60-1-11/17
Enamels for Aluminum on the Basis of the Lead-phosphate-silicate System

and Nr 257 - colored enamels) with a baking temperature of 540-580°. These enamels are resistant to 4% acetic acid, cold and boiling water. Heat dilatation of these enamels lies between 151.5 and 177.10⁻⁷. There are 2 figures, 4 tables, and 6 references, 5 of which are Soviet.

TITLE: Study of some factors affecting adhesion of enamels to aluminum (a preliminary statement)

PERIODICAL: Izvestiya Akademii Nauk Belorusskoy SSR. Seriya, no.3,
1962, 54-57

TEXT: Thermal expansion, viscosity of the vitreous enamel in softened state, and wetting of the metal by the enamel were investigated on 14 specimens of glass of different composition at 600°C and at lower temperatures. Natural sand and technical minium were used for the reparation of vitreous enamels. Other components were C.P. enamel coating and surface preparation of the metal were performed as described in authors' previous paper (Bezborodov,

Card 1/2

S/201/62/000/003/002/002
I001/I201

Study of some factors...

M.A. and others, DAN BSSR, no.7, 1959). The results of investigation showed that there is no single factor conditioning the strength of adhesion. Reducing the difference in the thermal expansion between the joining elements weakens the adhesion. Decrease of viscosity in the softened state of the enamel improves the adhesion. In the studied specimens lead oxide had the greatest power on reducing viscosity in softened state of the enamel. Boric anhydride and oxides of alkali metals substituting PbO increase the viscosity. In leadless enamels lithium oxide has the greatest effect on enamel scaling. There are 2 figures and 1 table.

TITLE: Influence of Al_2O_3 on some properties of glass in the $\text{MgO}-\text{Al}_2\text{O}_3-\text{SiO}_2$ system

SOURCE: Steklo i keramika, no. 6, 1964, 9-12

TOPIC TAGS: alumina containing glass, glass elasticity modulus, Al_2O_3 , glass property, magnesium oxide, physico chemical property

ABSTRACT: Because of the advantageous physico-chemical properties of the above glasses, their chemical stability, low thermal expansion coefficient, and insulating properties have been much studied. The authors amplify these studies including the investigation of the elasticity modulus. The samples were prepared at 1630°C. The area of vitrification in the state diagram applies to a composition containing 47.5-60% SiO_2 , 10-20% Al_2O_3 , and 25-40% MgO . At 45% SiO_2 , independent of the Al_2O_3 content, all glasses crystallize. Melting and clarifying of glasses with 45-50% silica contents already takes place at 1530°C. The majority of glasses belong to the cordierite type. Those of the mullite type are highly viscous and have valuable properties. The elasticity modulus was determined with the

Cord 1/2

ACCESSION NR: AP4040682

aid of ultrasonic resonance. All these glass types show high values of the elasticity modulus (between 10000 and 11000 kg/mm², compared with 4000-7000 kg/mm² for ordinary glass). The basic component enhancing the elasticity modulus is magnesium oxide. Conversely, higher SiO₂ content lowers the elasticity modulus. In this respect, Al₂O₃ plays a dual role, its optimum content being 15 mol%. The same applies to titanium. The capacity of these elements to change their coordination numbers explains this phenomenon. Orig. art. has: 6 figures,

TITLE: Glass for glass fiber. Class 32, No. 176458

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 3, 1966, 49

TOPIC TAGS: glass fiber, electric insulator

ABSTRACT: An Author Certificate has been issued for a glass for making glass fiber with improved electrical insulation properties and reduced cost. The glass has the following composition: SiO₂, 54–57%; Al₂O₃, 8–9%; CaO, 13–17%; SrO, 13–17%; MgO, not over 3.5%; and, in addition, BaO, 1.5–5%, and Fe₂O₃, not over 1.5%. [BO]

TITLE: Effect of additives on the crystallization of boronless,
alkaliless strontium containing glass

SOURCE: Ref. zh. Khimiya, Abs. 14M125

REF SOURCE: Sb. Stekloobrazn. sostoyaniye. T. 3. Vyp. 4. Minsk, 1964,
85-88

TOPIC TAGS: glass, fiber glass, crystallization property, strontium

ABSTRACT: The crystallization properties of the SrO - CaO - Al₂O₃ - SiO₂ system glass improves with the addition of MgO, BaO and MgO, BaO combined. At the same time the temperature of the crystallization upper limit lowers and the speed of crystallization growth decreases. The addition of B₂O₃ in a small amount (up to 4 mol%) improves the melting properties but impairs its crystallizing properties. P₂O₅ impairs both the melting as well the crystallizing properties of strontium glass. A No. 14 composition was developed which has optimal crystallization properties in accordance with requirements for glasses used in making glass fiber. I.M.

TITLE: Strontium glasses and their properties and applications

SOURCE: Vsesoyuznoye khimicheskoye obshchestvo. Zhurnal, v. 10, no. 5, 1965, 558-565

TOPIC TAGS: glass, strontium compound, strontium mineral, refractive index

ABSTRACT: Strontium oxide thus far has not found use in the glass industry of the USSR, which is due, on the one hand, to the limited exploration and assimilation of raw material deposits, and on the other, to the inadequate study of properties of strontium glasses. Relatively recently, inexhaustible reserves of strontium minerals have been suspected in the USSR, concentrated chiefly in Central Asia, which can be regarded as a geological province of strontium. This fact naturally has heightened interest of researchers in formulating new kinds of glasses based on strontium. Several studies have dealt with the effect of small additions of strontium oxide on the properties of lime-sodium glasses. The replacement of sodium oxide with 1-4% SrO in glasses of the following composition: SiO_2 -- 73.5%; CaO -- 10.5%; Na₂O -- 16%; has increased the

Card 1/2

temperature of the upper limit of crystallization, and improved viscosity and chemical resistance of the glass.

Among the most important and most typical properties of strontium glasses are the high indices of refraction and specific bulk resistance. Both alkali and nonalkali glasses are marked by good founding and working properties and by high water stability. Non-alkali glasses are characterized by higher resistance to alkali solutions, and good acid resistance is afforded when the composition contains not less than 60 mol.% silica. These valuable properties govern the areas of application of strontium-containing glasses and the possibility of replacing such short-supply materials as compounds of boron and lead. At present, strontium glasses have already found use in the production of optical, medical and chemico-laboratory glass. Orig. art. has: 5 figures and 7 tables. [JPRS]

TITLE: Effect of ionic radii M^{2+} on the properties of glasses

SOURCE: AN SSSR. Otdeleniye obshchey i tekhnicheskoy khimii. Issledovaniya v oblasti khimii silikatov i okislov (Studies in the field of chemistry of silicates and oxides). Moscow, Izd-vo Nauka, 1965, 63-67

TOPIC TAGS: beryllium compound, silicate glass, glass property

ABSTRACT: The systems $RO-Al_2O_3-SiO_2$, where $RO = SrO, MgO$ or BeO , were studied in the following concentration range of the components (mole %): SiO_2 , 45-60; Al_2O_3 , 0-20; RO , 20-55. The temperature of the upper crystallization limit, chemical stability, and elastic modulus were determined in glasses of the $SrO-Al_2O_3-SiO_2$, $MgO-Al_2O_3-SiO_2$, and $MgO-BeO-Al_2O_3-SiO_2$ systems. Comparison of the results shows that these properties change in regular fashion with the cationic radius of the divalent oxide. As the latter decreases, the temperature at which the glasses are melted and their crystallizability, chemical stability and elastic modulus increase. The Be^{2+} ion has the strongest force field and the smallest difference of force fields with silicon (0.7) as compared to Mg^{2+} (1.12) and Sr^{2+} (1.30). This explains the marked crystallizability of beryllium glasses observed in this study, and also the higher T_g of magnesium glasses

Card 1/2

L 06282-67

ACC NR: AT6027137

as compared to strontium glasses. As the ionic radii decrease and the force fields of Me^{2+} increase, the influence of Me^{2+} on the packing and rigidity of the glass structure grows, causing a rise in the fusion temperature and in the elastic modulus. The decrease in the cationic radius also increases the chemical stability, since the size of the cations washed out of the glass determines the porosity, and hence, the protective effect of the film formed on the glass during reactions with corrosive agents. Orig. art. has: 4 figures and 2 tables.

AUTHORS: Mazo, M. D., Engineer

TITLE: Plant modernization - an important means of increasing the output of chemical production

PERIODICAL: Khimicheskaya mashinostroyeniye, no. 1, 1963, 3 - 5

TEXT: A general report on work performed by the NIIKhIMMASH and its branches in cooperation with other institutes and chemical machinery works on the progress and economy obtained by modernization of existing plants is given. The Sumskiy mashinostroitel'nyy zavod im. Frunze (Sumsy Machine Works imeni Frunze) and the Tambovskiy kotel'no-mekhanicheskiy zavod (Tambov Boiler Plant) are mentioned. The leningradskiy filial NIIKhIMMASH (Leningrad Branch of the NIIKhIMMASH) had performed work on new direct-flow valves and centrifuges IIIH-1000 (PN-1000) and AIIB-1250 (APN-1250). The new mixer for resins of the type PCBH-45 (RSVD-45) and the new unit AHB-125 (ANV-125) used in the continuous vulcanization of cable components were developed by the Kiyevskiy zavod "Bol'shevik" (Kiyev Works "Bol'shevik"). Savings of metals amounting to more

than 200 tons in 1961 were achieved by the Fastovskiy zavod "Krasnyy oktyabr" (Fastov Works "Red October"). Improved filtration equipment, centrifugal granulators for ammonium nitrate and urea, contact and evaporating apparatus, immersion coolers, and complex modernization of chemical plants were achieved by team work in which the Leningrad Branch of the NIIKhIMMASH, CIAP, Novomoiskovskiy khimicheskiy kombinat (Novaya Moskva Chemical Combine) took part. Examples for such a cooperation are the new scheme of a plant for the production of butyl rubber developed by the NIIKhIMMASH and Giprokauchuk and the development of data sheets for ammonia, nitric acid, acetylene, urea, ammonium nitrate, superphosphate and potassium fertilizers by the NIIKhIMMASH together with the CIAP, the GIPROKhim, and chemical combines.

965. FEATURES OF THE ECG OF HEALTHY CHILDREN AT DIFFERENT AGES (Russian text) - Mazo R. E. Minsk - 1957, (106 pages)

Brief data of the peculiarities of the child's heart are presented. The nature of the ECG is described in detail. The author presents the data on leads, analyses the origin of the ECG and of its separate waves, and gives an analysis and also a characterization of different types of ECGs in children. The author's personal observations on 273 healthy children are presented. Each chapter contains the investigations of certain age groups and the conclusions about the peculiarities of ECGs in the group investigated. These differences are conditioned by the anatomical and physiological peculiarities of the growing heart. References 85. (S)

Title : Automatic Loading Regulator for Ball Mills

Orig Pub : Steklo i keramika, 1956, No 10, 14-16

Abstract : Description of an experimental specimen of an automatic, electric loading regulator to the input of which is supplied the signal of proportional power utilized by the electric motor of the ball mill. By means of a magnetic starter the regulator effectuates a 2-position regulation, including a definite zone of non-response, of the electric motor which actuates the ball mill charging mechanism. A block diagram of the regulation system is shown. The described apparatus can be successfully utilized to regulate the charging of ball mills, disintegrators, ore grinders, crusher-roll mills and other continuous operation equipment.

ABSTRACT:

As can be seen from the papers by V. A. Golubtsov, I. Ya. Zai-kind, T. V. Bursian (Ref 1), the common torsion-viscosimeter has been hitherto employed for the above purpose. It shows, however, a number of deficiencies. The NIIStroykeramika has worked out a new type of viscosimeter (Fig 1) based upon a different principle. The moment caused by friction and no longer the filar angle of rotation is measured. The respective scheme is shown in figures 2 and 3, and a description is given in detail. An electronic potentiometer of the EPP-09 type is used for the automatic recording of viscosity. Figure 4 shows the course of temperature with respect to time and figure 5 presents a calibration curve. The logarithmic dependence of viscosity on temperature is illustrated in figure 6.

TITLE: Device for programmed control of temperature of periodic electric furnaces

PERIODICAL: Friborostroyeniye, no. 3, 1963, 10-12

TEXT: The authors describe briefly the operation of a hybrid electronic program controller for periodically operated electric furnaces. With d.c. voltage at the input of the valve preamplifier, it operates as a relay, while an a.c. voltage applied to the input results in output pulses the duration of which, and hence the mean load current, is determined by the interval during which the input forming voltage reaches two consecutive predetermined values. The preamplifier controls a transistorized magnetic amplifier with output up to 30 kW. The programmer pick-up is in the form of a stencil, the outer contours of which represent the heating and cooling cycles of the furnace and govern the position of the slider of the potentiometer setting the input voltage. Practical results ob-
